Introduction to Network Science

I. Makarov & L.E. Zhukov

BigData Academy MADE from Mail.ru Group

Social Network Analysis and Machine Learning on Graphs

Class Details

- Instructor: Ilya Makarov
- Tutor: Vitaly Pozdnyakov
- Invited lecturers: Andrey Kuznetsov, Dmitrii Kiselev
- Course length: 15 lectures/classes
- Lecturer's Telegram: @iamakarov (urgent)
- Tutor's Telegram: @pozdnyakov_vitaliy (urgent)
- Discord (questions, deadlines, grading)
- Programming: Python, iPython notebooks, Anaconda distribution
- Python libraries: NetworkX
- Visualization: yEd, Gephi

Prerequisites

- Discrete Mathematics
- Linear Algebra
- Algorithms and Data Structures
- Probability Theory
- Differential Equations
- Programming in Python

Textbooks

- "Network Science", Albert-Laszlo Barabasi, Cambridge University Press, 2016. http://networksciencebook.com
- "Networks: An Introduction". Mark Newman. Oxford University Press, 2010.
- "Social Network Analysis. Methods and Applications". Stanley Wasserman and Katherine Faust, Cambridge University Press, 1994
- "Networks, Crowds, and Markets: Reasoning About a Highly Connected World". David Easley and John Kleinberg, Cambridge University Press 2010.

Topics

- Statistical properties and network modeling
- Network structure and dynamics
- Processes on networks
- Predictions on networks (ML)
- Network embeddings
- Graph neural networks
- Knowledge graph retrieval and completion
- Spark and BigData for relational Data
- Distributed ML on large graphs

Descriptive Analysis

- Introduction to network science
- Power law and scale-free networks
- Random graphs
- Small world and dynamical growth models
- Centrality measures
- Pagerank and link analysis
- Structural similarity in networks
- Network cores and community structure
- Graph partitioning algorithms
- Community detection

Network science

- Sociology (SNA)
- Mathematics (Graphs)
- Computer Science (Graphs)
- Statistical Physics (Complex networks)
- Economics (Networks)
- Bioinformatics (Networks)

Research Journals

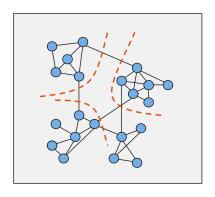

- IEEE Transactions on Network Science and Engineering [IEEE, 2014]
- Network Science [Cambridge University Press, 2013]
- Journal of Complex Networks [Oxford Academic, 2013]
- Social Network Analysis and Mining [Springer, 2011]
- Social Networks [Elsevier, 1979]

- Int. Journal of Network Science, [InderScience Publishers, 2016]
- Computational Social Networks [SpringerOpen, 2014]
- Journal of Complex Networks [Oxford Academic, 2013]
- Social Networking [Scientific Research publisher, 2012]
- International Journal of Social Network Mining (IJSNM) [InderScience Publishers, 2012]

Conferences

- International School and Conference on Network Science, NetSci, NetSci-X
- International Workshop on Complex Networks and their Applications, Complenet
- SIAM Workshop on Network Science
- International Conference on Computational Social Science, IC²S²
- International Conference on Social Network Analysis, INSNA
- StatPhys Satellite Conference Complex Networks
- ACM Conference on Online Social Networks
- Conference on Complex Systems

Terminology

- network = graph
- nodes = vertices, actors
- links = edges, relations
- clusters = communities

- **Network** is represented by a graph G(V, E), comprising a set of vertices V and a set of edges E, connecting those vertices.
- **Graph** can be represented by an adjacency matrix A, where A_{ij} -availability of an edge between nodes i and j
- In an **unweighted graph** A_{ij} is binary $\{0,1\}$, in a **weighted graph** an edge can carry a weight, A- non-binary.
- **Undirected graph** is a graph where edges have no orientation, edges are defined by unordered pairs of vertices, $A_{ij} = A_{ji}$
- **Directed graph** is a graph where edges have a direction associated with them, edges are defined by ordered pairs of vertices, $A_{ij} \neq A_{ji}$

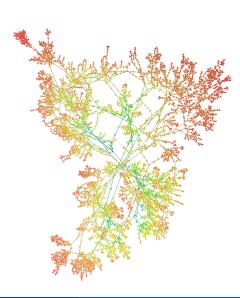

- A path between nodes i and j is a sequence of edges connecting vertices, starting at i and ending at j, where every vertex in the sequence is distinct
- **Distance** between two vertices in a graph is the number of edges in a shortest path (graph geodesic) connecting them.
- The diameter of a network is the largest shortest paths (distance between any two nodes) in the network
- Average path length is bounded from above by the diameter; in some cases, it can be much shorter than the diameter

- A graph is connected when there is a path between every pair of vertices.
- A connected component is a maximal connected subgraph of the graph. Each vertex belongs to exactly one connected component, as does each edge.
- A directed graph is called weakly connected if replacing all of its directed edges with undirected edges produces a connected (undirected) graph.
- A directed graph is strongly connected if it contains a directed path between every pair of vertices. A directed graph can be connected but not strongly connected.

- The degree of a vertex of a graph is the number of edges incident to the vertex
- A vertex with degree 0 is called an **isolated vertex**.
- In a directed graph the number of head ends adjacent to a vertex is called the in-degree of the vertex and the number of tail ends adjacent to a vertex is its out-degree
- A vertex with in-degree=0 is called a source vertex, with out-degree=0 is a sync vertex

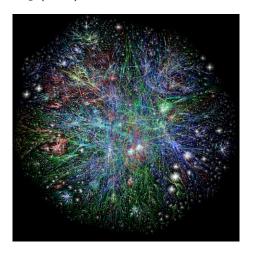

Complex networks

- not regular, but not random
- non-trivial topology
- scale-free networks
- universal properties
- everywhere
- complex systems

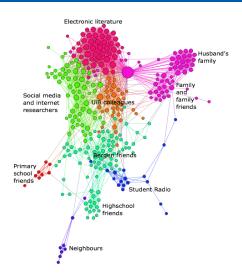

Examples: Internet

Triads

The Strength of Weak Ties1

Mark S. Granovetter Johns Hopkins University

Analysis of social networks is suggested as a tool for linking micro and marco levels of sociological theory. The procedure is illustrated by elaboration of the macro implications of one aspect of small-scale interaction: the strength of dyadic ties. It is argued that the degree of overlap of two individuals' friendship networks varies directly with the strength of their tie to one another. The impact of this principle on diffusion of influence and information, mobility opportunity, and community organization is explored. Stress is laid on the cohesive power of weak ties. Most network models deal, implicitly, with strong ties, thus confining their applicability to small, well-defined groups. Emphasis on weak ties lends itself to discussion of relations between groups and to analysis of segments of social structure not easily defined in terms of primary groups.

- "The Strength of Weak Ties", Mark Grannoveter, 1973
- "Spread of Information through a Population with Socio-Structural Bias. Assumption of Transitivity", Anatol Rapoport, 1953

Triadic closure

- strength of a tie
- high transitivity
- high clustering coefficient

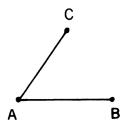

Fig. 1.—Forbidden triad

If A and B and C are strongly linked, the tie between B and C is always present

Small world: six degrees of separation

An Experimental Study of the Small World Problem*

JEFFREY TRAVERS

Harvard University

AND

STANLEY MILGRAM

The City University of New York

Arbitrarily selected individuals (N=205) in Nebrasha and Bosson are asked to generate acquaintance chains to a larget person in Massachusetts, employing "the small world method" (Milgram, 1967). Sixty-four chains reach the target person. Within this group the mean number of intermediaries the tween staters and targets is 5.2. Bosson starting chains reach the target person with fewer intermediaries than those starting in Nebrasha; subpopulations in the Nebrasha group do not differ among themselves. The funneling of chains through sociometric "stars" is noted, with 48 per cent of the chains passing through three persons before reaching the target. Applications of the method to studies of large scale social structure are discussed.

- "The small-world problem". Stanley Milgram, 1967
- "An experimental study of the small world problem", Jeffrey Travers, Stanley Milgram, 1969

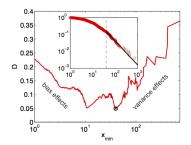

Stanley Milgram's 1967 experiment

HOW TO TAKE PART IN THIS STUDY

- ADD YOUR NAME TO THE ROSTER AT THE BOT-TOM OF THIS SHEET, so that the next person who receives this letter will know who it came from.
- DETACH ONE POSTCARD. FILL IT OUT AND RE-TURN IT TO HARVARD UNIVERSITY. No stamp is needed. The postcard is very important. It allows us to keep track of the progress of the folder as it moves toward the target person.
- IF YOU KNOW THE TARGET PERSON ON A PER-SONAL BASIS, MAIL THIS FOLDER DIRECTLY TO HIM (HER). Do this only if you have previously met the target person and know each other on a first name basis.
- 4. IF YOU DO NOT KNOW THE TARGET PERSON ON A PERSONAL BASIS, DO NOT TRY TO CONTACT HIM DIRECTLY. INSTEAD, MAIL THIS FOLDER (POST-CARDS AND ALL) TO A PERSONAL ACQUAIN-TANCE WHO IS MORE LIKELY THAN YOU TO KNOW THE TARGET PERSON. You may send the folder

Stanley Milgram's 1967 experiment

- Starting persons:
 - 296 volunteers, 217 sent
 - 196 in Nebraska
 - 100 in Boston
- Target person Boston stockbroker
- Information given: target name, address, occupation, place of employment, college, hometown

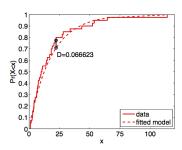

J. Travers, S. Milgram, 1969

Stanley Milgram's 1967 experiment

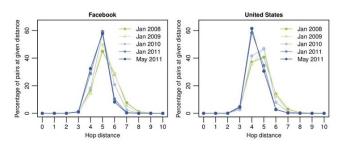

- Reached the target N = 64(29%)
- Average chain length $\langle L \rangle = 5.2$
- Channels:
 - hometown $\langle L \rangle = 6.1$
 - business contacts $\langle L \rangle = 4.6$
 - from Boston $\langle L \rangle = 4.4$
 - from Nebraska $\langle L \rangle = 5.7$

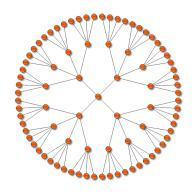

Small world

- Email graph:
 - D. Watts (2001), 48,000 senders, $\langle L \rangle \approx 6$
- MSN Messenger graph:
 - J. Leskovec et al (2007), 240mln users, $\langle L \rangle \approx 6.6$
- Facebook graph:
 - L. Backstrom et al (2012), 721 mln users, $\langle L \rangle \approx 4.74$

Simple model

An estimate: $z^d = N$, $d = \log N / \log z$ $N \approx 6.7$ bln, z = 50 friends, $d \approx 5.8$.

Node degree distribution

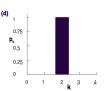

- k_i node degree, i.e. number of nearest neighbors, $k_i = 1, 2, ... k_{max}$
- n_k number of nodes with degree k, $n_k = \sum_i \mathcal{I}(k_i == k)$
- total number of nodes $N = \sum_k n_k$
- ullet Degree distribution is a fraction of the nodes with degree k

$$P(k_i = k) = P_k = \frac{n_k}{\sum_k n_k} = \frac{n_k}{N}$$

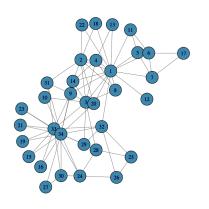

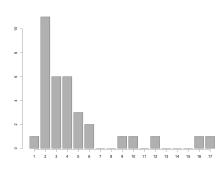

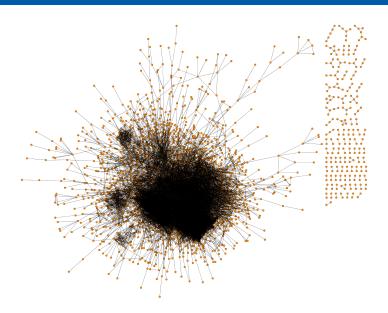

Node degree distribution

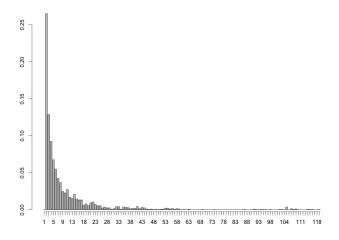

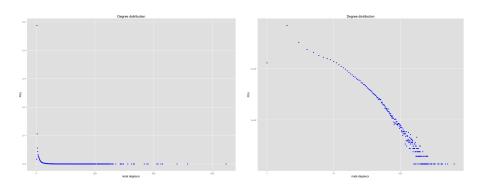

Degree distribution

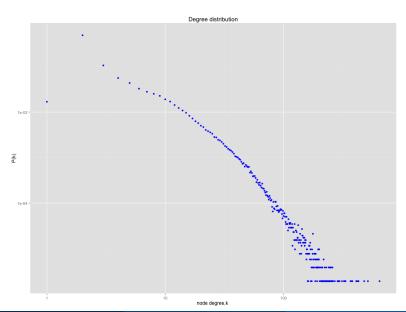

Degree distribution

Power law degree distribution

Power law degree distribution

Discrete power law distribution

• Power law distribution, $k \in \mathbb{N}$, $\gamma \in \mathbb{R} > 0$

$$P_k = Ck^{-\gamma} = \frac{C}{k^{\gamma}}$$

Log-log coordinates

$$\log P_k = -\gamma \log k + \log C$$

Normalization

$$\sum_{k=1}^{\infty} P_k = C \sum_{k=1}^{\infty} k^{-\gamma} = C\zeta(\gamma) = 1; \quad C = \frac{1}{\zeta(\gamma)}$$

• Riemann zeta function, $\gamma > 1$

$$P_k = \frac{k^{-\gamma}}{\zeta(\gamma)}$$

Power law continuous approximation

• Power law, $k \in \mathbb{R}$, $\gamma \in \mathbb{R} > 0$

$$p(k) = Ck^{-\gamma} = \frac{C}{k^{\gamma}}, \text{ for } k \ge k_{min}$$

• Normalization $(\gamma > 1)$

$$1 = \int_{k_{\min}}^{\infty} p(k)dk = C \int_{k_{\min}}^{\infty} \frac{dk}{k^{\gamma}} = \frac{C}{\gamma - 1} k_{\min}^{-\gamma + 1}$$

$$C=(\gamma-1)k_{\mathsf{min}}^{\gamma-1}$$

Power law normalized PDF

$$p(k) = (\gamma - 1)k_{\min}^{\gamma - 1}k^{-\gamma} = \frac{\gamma - 1}{k_{\min}}\left(\frac{k}{k_{\min}}\right)^{-\gamma}$$

Moments

• Power law PDF, $\gamma > 1$:

$$p(k) = \frac{C}{k^{\gamma}}, \ k \ge k_{min}; C = (\gamma - 1)k_{min}^{\gamma - 1}$$

• First moment (mean value), $\gamma > 2$:

$$\langle k \rangle = \int_{k_{\min}}^{\infty} k p(k) dk = C \int_{k_{\min}}^{\infty} \frac{dk}{k^{\gamma - 1}} = \frac{\gamma - 1}{\gamma - 2} k_{\min}$$

• Second moment, $\gamma > 3$:

$$\langle k^2 \rangle = \int_{k_{\min}}^{\infty} k^2 p(k) dk = C \int_{k_{\min}}^{\infty} \frac{dk}{k^{\gamma - 2}} = \frac{\gamma - 1}{\gamma - 3} k_{\min}^2$$

• m-th moment, $\gamma > m+1$:

$$\langle k^m \rangle = \int_{k_{min}}^{k_{max}} k^m p(k) dk = C \frac{k_{max}^{m+1-\gamma} - k_{min}^{m+1-\gamma}}{m+1-\gamma}$$

Hubs in networks

- How does the network size affect the size of its hubs(natural cutoff)?
- Probability of observing a single node with degree $k > k_{max}$:

$$Pr(k \ge k_{\max}) = \int_{k_{\max}}^{\infty} p(k)dk$$

• Expected number of nodes with degree $k \ge k_{\text{max}}$:

$$N \cdot Pr(k \ge k_{\mathsf{max}}) = 1$$

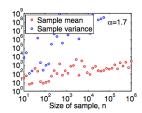

• Expected largest node degree in exponential network $p(k) = Ce^{-\lambda k}$

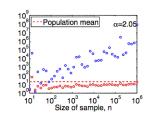

$$k_{max} = k_{min} + \frac{\ln N}{\lambda}$$

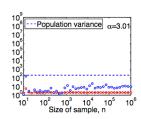

• Expected largest node degree in power law network $p(k) = Ck^{-\gamma}$

$$k_{max} = k_{min} N^{\frac{1}{\gamma-1}}$$

Moments

$$\langle k \rangle = C \frac{k_{\text{max}}^{2-\gamma} - k_{\text{min}}^{2-\gamma}}{2-\gamma}, \qquad \langle k^2 \rangle = C \frac{k_{\text{max}}^{3-\gamma} - k_{\text{min}}^{3-\gamma}}{3-\gamma}$$

$$\sigma^2 = \langle k^2 \rangle - \langle k \rangle^2$$

Clauset et.al. 2009

Scale free network

Degree of a randomly chosen node:

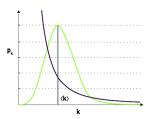

$$k = \langle k \rangle \pm \sigma_k, \quad \sigma_k^2 = \langle k^2 \rangle - \langle k \rangle^2$$

Poisson degree distribution (random network) has a scale $\langle k \rangle$:

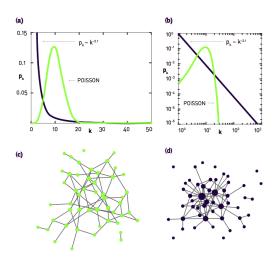

$$k = \langle k \rangle \pm \sqrt{\langle k \rangle}$$

Power law network with 2 $< \gamma <$ 3 is scale free:

$$k = \langle k \rangle \pm \infty$$

Plotting power Laws

Power law PDF

$$p(k) = Ck^{-\gamma}; \log p(k) = \log C - \gamma \log k$$

• Cumulative distribution function (CDF)

$$F(k) = Pr(k_i \le k) = \int_0^k p(k)dk$$

Complimentary cumulative distribution function cCDF

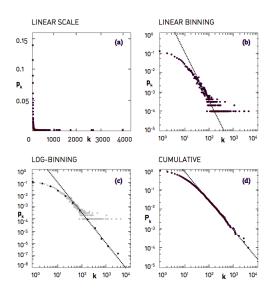

$$\bar{F}(k) = Pr(k_i > k) = 1 - F(k) = \int_k^\infty p(k)dk$$

Power law cCDF

$$ar{F}(k) = rac{C}{\gamma - 1} k^{-(\gamma - 1)}$$

$$\log ar{F}(k) = \log rac{C}{\gamma - 1} - (\gamma - 1) \log k$$

Plotting power laws

Parameter estimation: γ

Maximum likelihood estimation of parameter γ

• Let $\{x_i\}$ be a set of n observations (points) independently sampled from the distribution

$$P(x_i) = \frac{\gamma - 1}{x_{\min}} \left(\frac{x_i}{x_{\min}}\right)^{-\gamma}$$

Probability of the sample sequence

$$P(\lbrace x_i \rbrace | \gamma) = \prod_{i}^{n} \frac{\gamma - 1}{x_{\min}} \left(\frac{x_i}{x_{\min}} \right)^{-\gamma}$$

Maximum likelihood

log-likelihood

$$\mathcal{L} = \ln P(\gamma | \{x_i\}) = n \ln(\gamma - 1) - n \ln x_{\min} - \gamma \sum_{i=1}^{n} \ln \frac{x_i}{x_{\min}}$$

• maximization $\frac{\partial \mathcal{L}}{\partial \gamma} = \mathbf{0}$

$$\gamma = 1 + n \left[\sum_{i=1}^{n} \ln \frac{x_i}{x_{\min}} \right]^{-1}$$

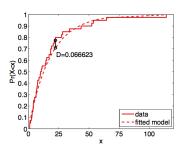

error estimate

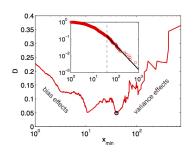

$$\sigma = \sqrt{n} \left[\sum_{i=1}^{n} \ln \frac{x_i}{x_{\min}} \right]^{-1} = \frac{\gamma - 1}{\sqrt{n}}$$

Parameter estimation: k_{min}

Kolmogorov-Smirnov test (compare model and experimental CDF)

$$D = \max_{x} |F(x|\gamma, x_{min}) - F_{exp}(x)|$$

find

$$x_{min}^* = argmin_{x_{min}}D$$
